You may not use this work or derivative works for commercial purposes. If you alter, transform, or build upon this work you may distribute the resulting work only under the same or similar license.

This Data Science Course was developed for keuzevak- program of the [School of Communication, Media and Information Technology \(CMI\)](#) at the Hogeschool Rotterdam (**Rotterdam University of Applied Sciences, RUAS**).

If you find errors or omissions, please contact the author, Rob van der Willigen, at [r.f.van.der.willigen@hr.nl](mailto:r.f.van.der.willigen@hr.nl). Materials of this course and code examples used will become available at:

<https://github.com/robvdw/CMIDAT01K-DATA-SCIENCE-for-IOT>

# Course Setup

**Lesson 01:** **Discovering the IoT Data Science Domain**

**Lesson 02:** **Defining project requirements**

**+ Cost calculation/estimate**

**Lesson 03-05:** **Autonomous project work**

**Lesson 06-07:** **Demonstrating working IoT prototype**

**Lesson 08:** **Wrap-up**

**Week 09 / 10: FEEDBACK + GRADING**

# About this course

# Data Science for IoT is about ...

---

Experimenting, prototyping & Iterating

Concepting, Testing and Debugging

Reusing and Remixing

Abstracting and Documentation

Keeping a (GitHub) Journal + code commenting

# Documentation

---

Domain knowledge

Prototype-Iteration

Concept + Design Scenarios

Code

Feedback

# IoT-project questions that need to be answered

---

Show me what you are working on?

What is it about?

What makes it a Data Science for IoT project?

What steps did you take to plan the project?

What coding IDE did you use?

What hardware did you use and how is it connected to the internet?

Which IoT platform did you choose & why?

Did the plan change at all over time?

What did you do when you had to change the plan and how did the program then work?

# Define for yourself

---

If someone new came to our class and asked you about data science for IoT:

**what it is, how it works and  
what you can do with it -  
what would you tell them?**

## Hardware

---

Microcontroller technology  
Sensor technology  
Hardware integration  
Physical design (3d)  
Testing

## Software

---

Web application development  
Microcontroller programming  
Software integration

# IoT-project Scenario Example

---

Imagine you would like to know the weather outside in your garden.

In an ideal IoT world, you would have a range of sensors, for example, a temperature sensor that can talk directly to the Internet.

This would be achieved by sending the temperature data from the sensor directly to a backend service via the Internet.

The backend service would probably display the data on a web page and would ideally offer the ability to display and analyze the data on your phone.

# Learning Objective

During the course, students will:

- Create + Describe a Internet of Things (IoT) concept/scenario
- Become familiar with the concepts surrounding IoT applications by building them such as Data Science & Computational Thinking
- Learn to design and develop simple lightweight IoT prototypes
- Learn to work independently to prepare a interactive prototype of an IoT product

# Deliverables:

- A working prototype that includes software (code), hardware and electronics elements.
- Code for the application
- Documentation + Evidence of the IoT project (contributed to GitHub).
- Demonstration of the completed project (annotated video)

# Choosing an IoT-project

## **Think Big / Act Small**

The main objective is to choose something you ***care*** about.

Having a project that's genuinely interesting to you is going to be best.

Keep in mind that it should be reasonably well scoped.

Choose something small, discrete and easy to implement

Identify a small solvable problem that illustrate your key IoT idea/concept.

Keep it constrained but conceptually interesting.

# Submitting your IoT-project

Documentation should be posted to GitHub as a new Repository.

Hands-on guide for working with this platform can be [found here](#).

You should document your project thoroughly including:

- *A description of the concept and goals (include video and/or diagrams as needed.)*
- *A description of relevant prior projects, approaches or methods you researched and that inspired the project. Be thorough and show what informed the project.*
- *The process you underwent to reach the outcome (experiments, hacks, tests, refinements, iterations, failures)*
- *The outcome itself and how it works. Include supporting images, a video of the working prototype, circuit diagrams, etc.)*
- *Outline next steps and future directions.*
- *Add/upload code (with comments) and any supporting documentation and files.*

# Grading

The most important thing for this project is to come up with a **compelling concept** - something interesting, informed, aware or critical.

The breakdown of the grades favors your ability to come up with an idea like this. Focus on the idea before implementation!

***This IoT course is a way for you to showcase:***

- Your engagement and understanding of the Data Science for IoT domain
- Your creative capacity + explanation of the IoT-concept/scenario
- Your own development in technical (coding-)skills

# Grading

A strong grade will result by creating interesting, well-crafted and well documented projects.

As such, each creative project will be graded as follows:

- 30% - Technical Implementation - Quality of code and execution of the outcome
- 20% - Creativity of Approach and Topic - Merit, Coding, and Context for the outcome/proposal
- 20% - Outcome Documentation - Well illustrated with appropriate use of code, video, diagrams, repeatability, etc.
- 20% - Git-Hub Repository and/or Maker Meet-Up Demonstration - high quality and well narrated demonstration of the solution
- 10% - Process - Description of process (ideation, iteration, etc.) and personal reflection on learning outcomes of technical skills

# **lesson one**

# LES: 01

**IoT + DataScience Domain explained**

**Raspberry Pi**

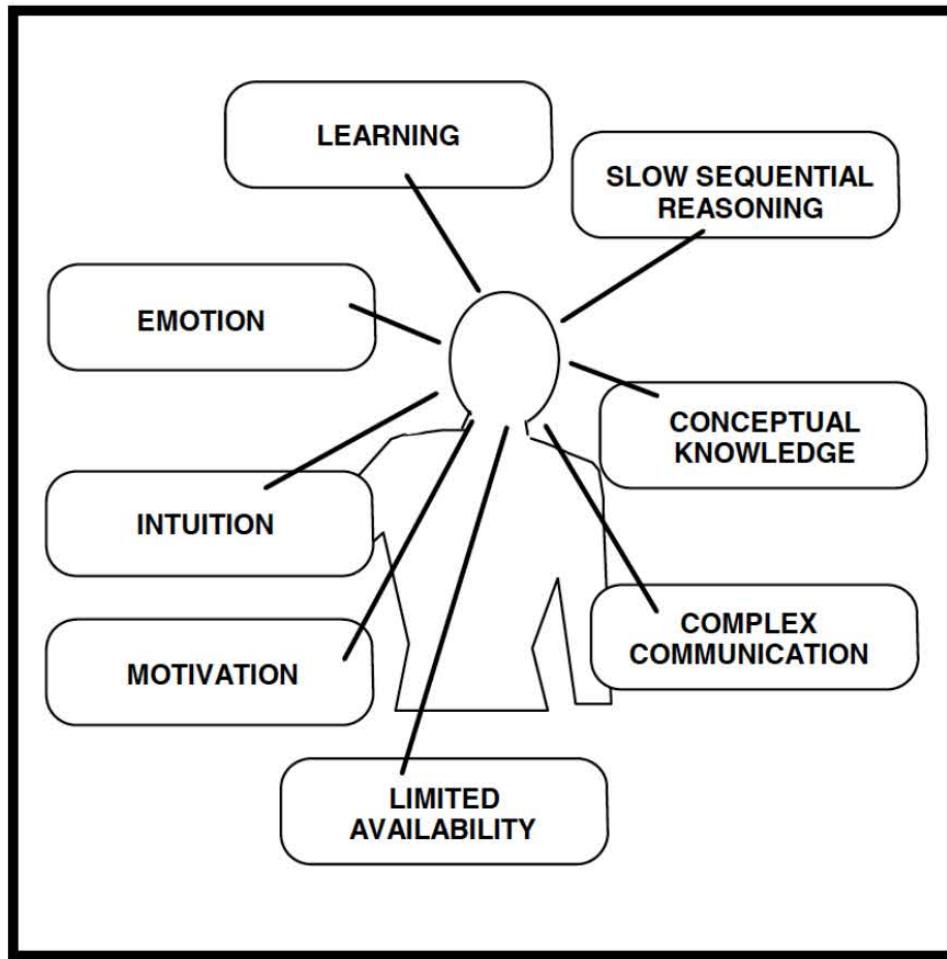

**Assignment**

**Preview Les 02**

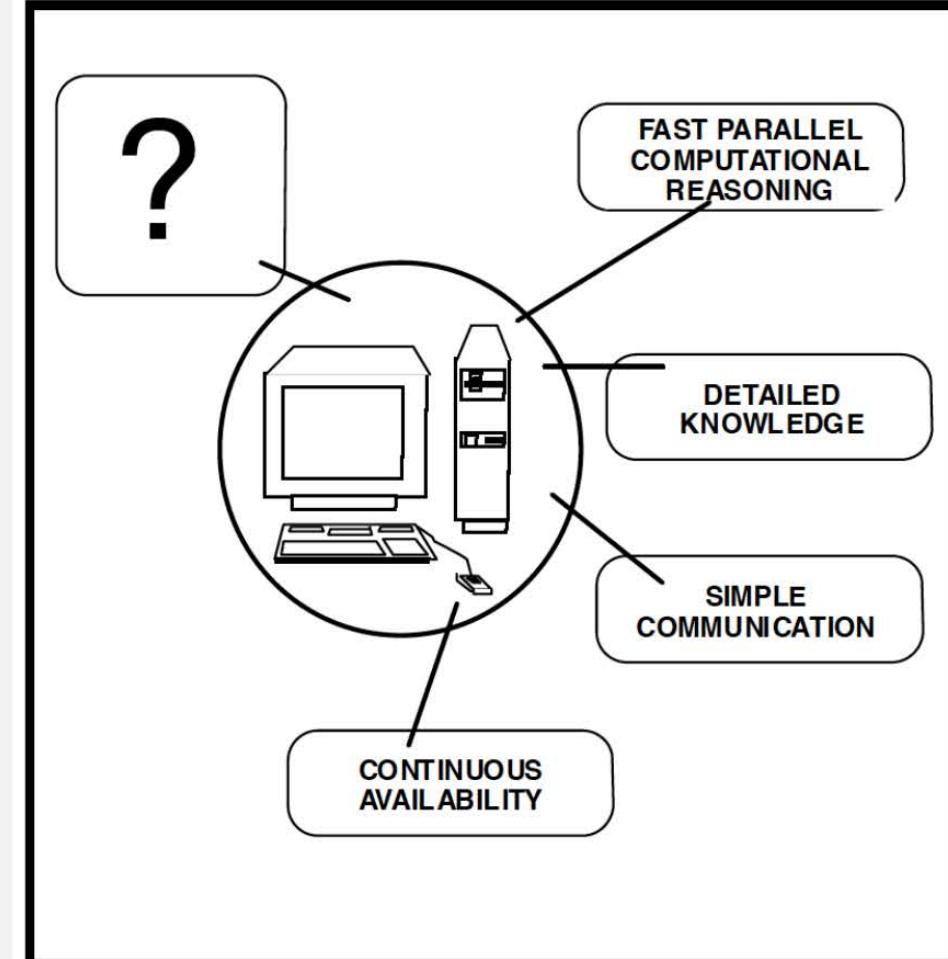

# Data Science

# Waarom Data Science?

Humans are pattern-driven

Computers are data-driven

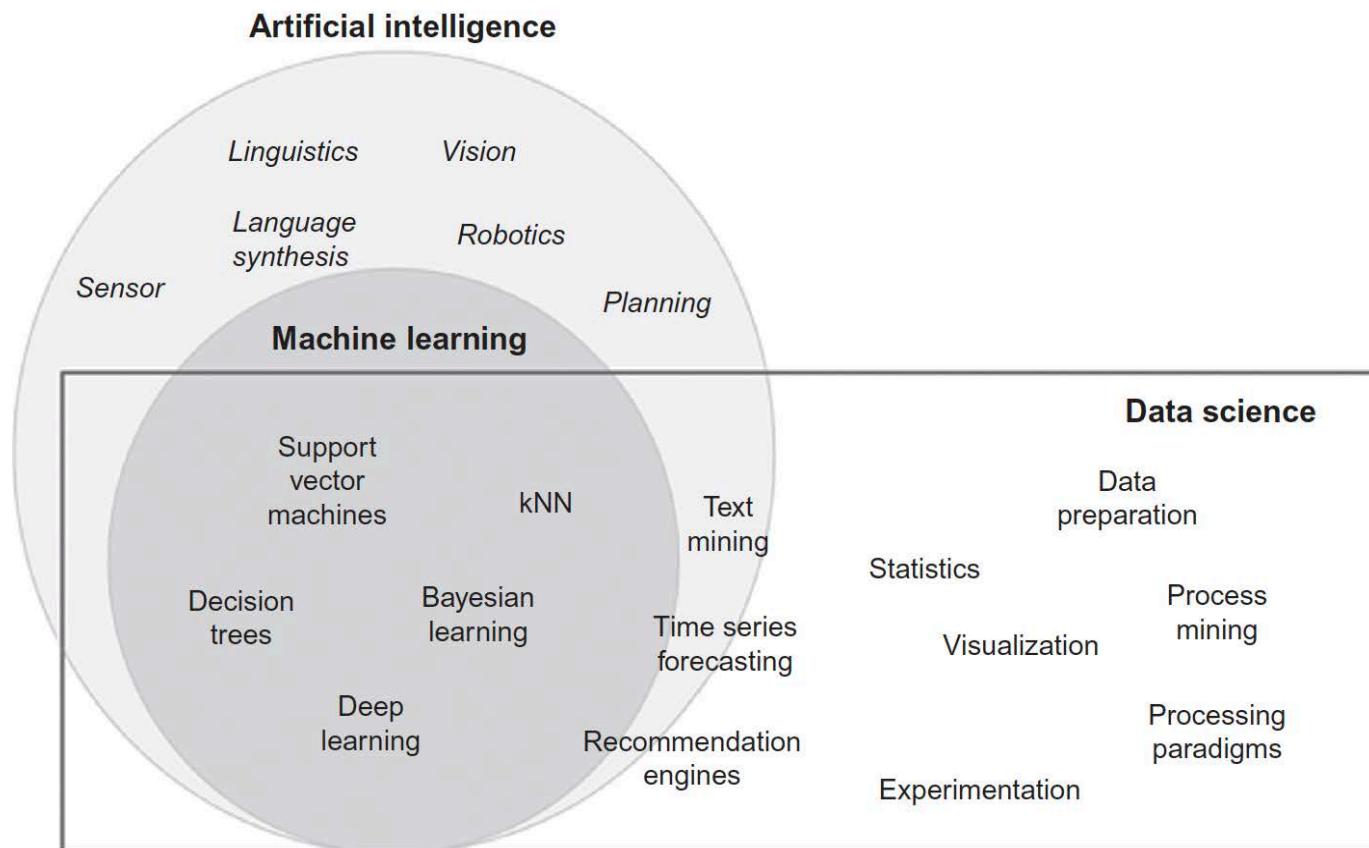

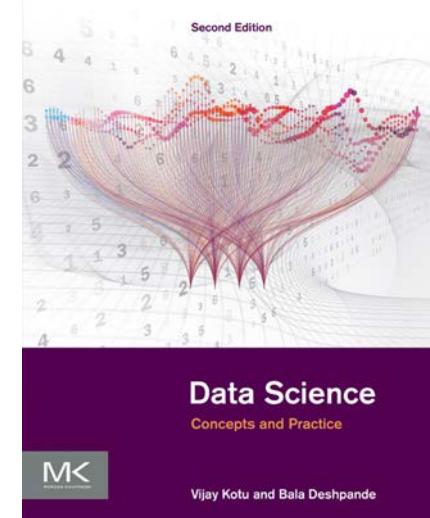

# Waarom Data Science?

Veel van de huidige  
**maatschappelijke en wetenschappelijke**  
**vraagstukken zijn dermate complex**  
dat zij niet zonder de hulp van **computertechnologie**  
opgelost kunnen worden.

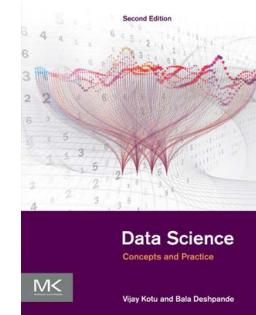

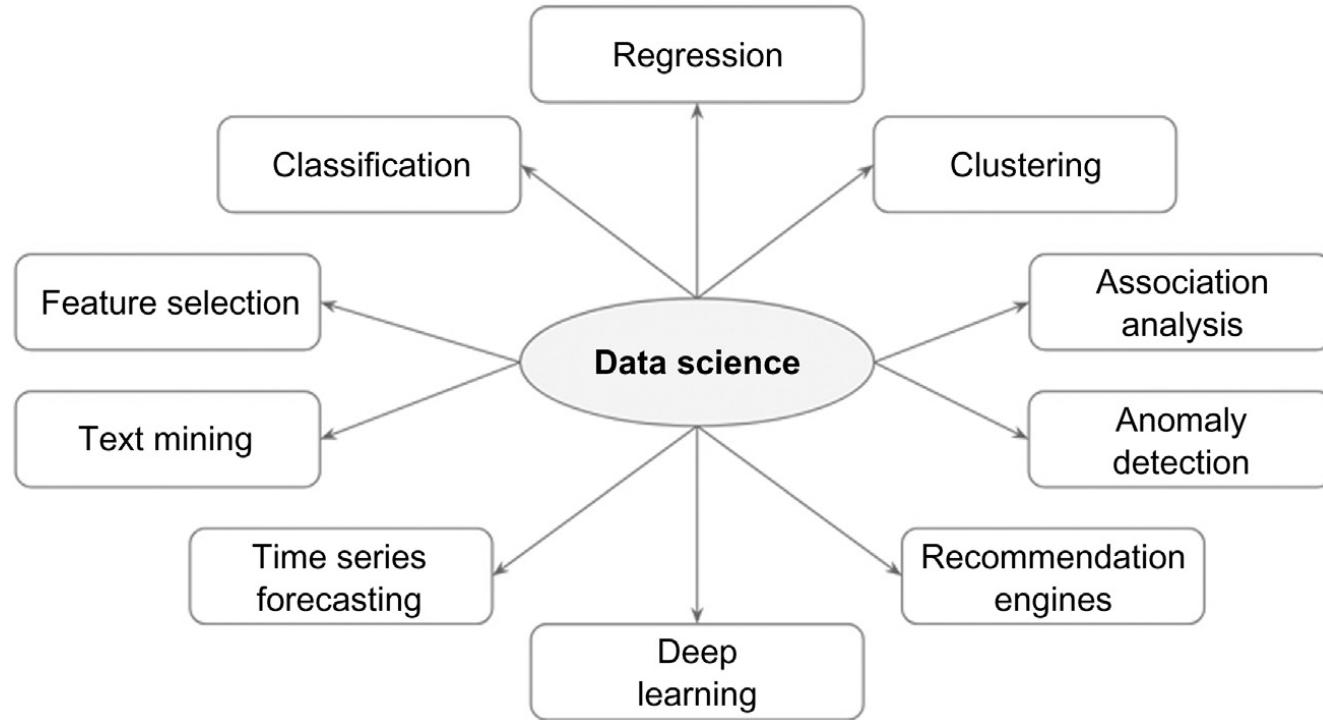

Bij deze vraagstukken is de **rekenkracht van de**  
**computer** nodig om tot een **oplossing** te komen.

# Data Science:

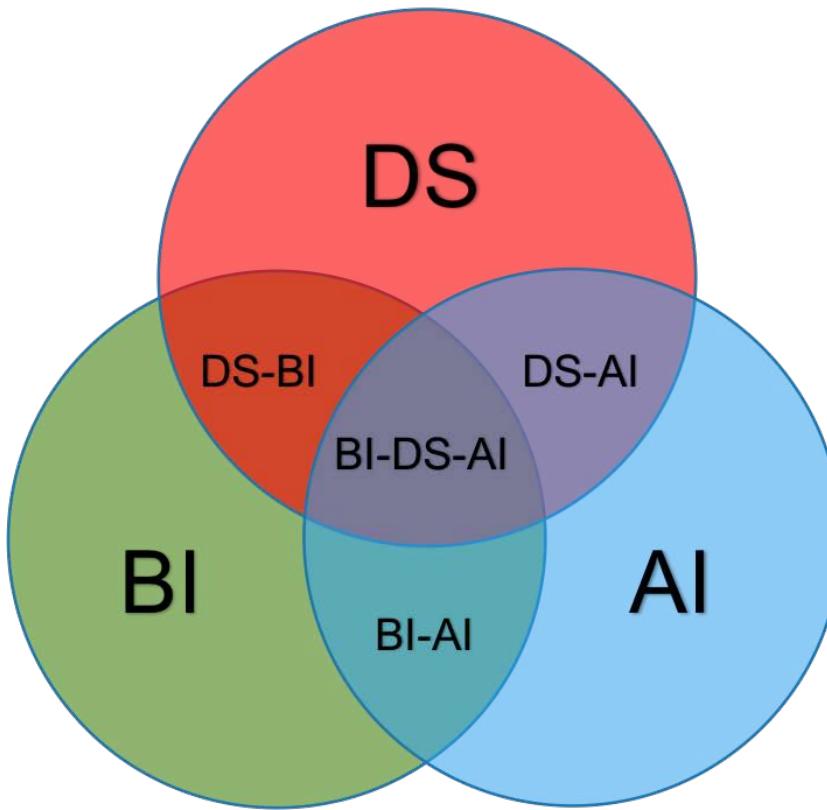

## Comprises many Techniques that extract Value from Data

# Data Science: Many Skills

Data Science refers to an emerging area of work concerned with the collection, preparation, analysis, visualization, management, and preservation of large collections of information. Although the name Data Science seems to connect most strongly with areas such as databases and computer science, many different kinds of skills - including non-mathematical skills - are needed.

Thinking like a **data scientist**  
means more than being able to  
program a computer.

It requires thinking at multiple  
levels of abstraction called  
**Computational Thinking**

**Viewpoint** | Jeannette M. Wing

## Computational Thinking

*It represents a universally applicable attitude and skill set everyone, not just computer scientists, would be eager to learn and use.*

Computational thinking builds on the power and limits of computing processes, whether they are executed by a human or by a machine. Computational methods and models give us the courage to solve problems and design systems that no one of us would be capable of tackling alone. Computational thinking confronts the riddle of machine intelligence: What can humans do better than computers? and What can computers do better than humans? Most fundamentally it addresses the question: What is computable? Today, we know only parts of the answers to such questions.

Computational thinking is a fundamental skill for everyone, not just for computer scientists. To reading, writing, and arithmetic, we should add computational thinking to every child's analytical ability. Just as the printing press facilitated the spread of the three Rs, what is appropriately incestuous about this vision is that computing and computers facilitate the spread of computational thinking.

Computational thinking involves solving problems, designing systems, and understanding human behavior, by drawing on the concepts fundamental to computer science. Computational thinking includes a range of mental tools that reflect the breadth of the field of computer science.

Having to solve a particular problem, we might ask: How difficult is it to solve? and What's the best way to solve it? Computer science rests on solid theoretical underpinnings to answer such questions pre-

cisely. Stating the difficulty of a problem accounts for the underlying power of the machine—the computing device that will run the solution. We must consider the machine's instruction set, its resource constraints, and its operating environment.

In solving a problem efficiently, we might further ask whether an approximate solution is good enough, whether we can use randomization to our advantage, and whether false positives or false negatives are allowed. Computational thinking is reformulating a seemingly difficult problem into one we know how to solve, perhaps by reduction, embedding, transformation, or simulation.

Computational thinking is thinking recursively. It is parallel processing. It is interpreting code as data and data as code. It is type checking as the generalization of dimensional analysis. It is recognizing both the virtues and the dangers of aliasing, or giving someone or something more than one name. It is recognizing both the cost and power of indirect addressing and procedure call. It is judging a program not just for correctness and efficiency but for aesthetics, and a system's design for simplicity and elegance.

Computational thinking is using abstraction and decomposition when attacking a large complex task or designing a large complex system. It is separation of concerns. It is choosing an appropriate representation for a problem or modeling the relevant aspects of a problem to make it tractable. It is using invariants to describe a system's behavior succinctly and declaratively. It is having the confidence we can safely use, modify, and influence a large complex system without understanding its every detail. It is

LEAH HANLY

# Computational Thinking

Computational thinking richt zich op de vaardigheden die essentieel zijn om problemen op te lossen waarbij veel informatie, variabelen en rekenkracht nodig zijn.

Het is daarbij belangrijk om te begrijpen hoe informatie tot stand komt zodat je computersystemen kan benutten voor probleemoplossen, voor het denken in stappen en daarmee in voorwaardelijkheden voor volgorde van de benodigde gegevens.

Computertechnologie gebruiken bij het zoeken naar oplossingen ---*Data Science*--- betekent inzicht krijgen in algoritmes (een reeks instructies om vanaf een beginpunt een bepaald doel te bereiken) en procedures (een verzameling activiteiten die in een bepaalde volgorde moet worden uitgevoerd).

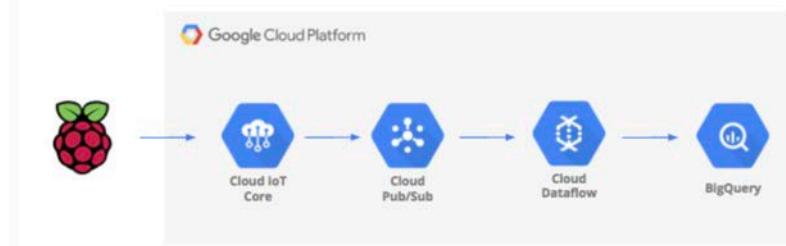

# Engineering a IoT Data Pipeline

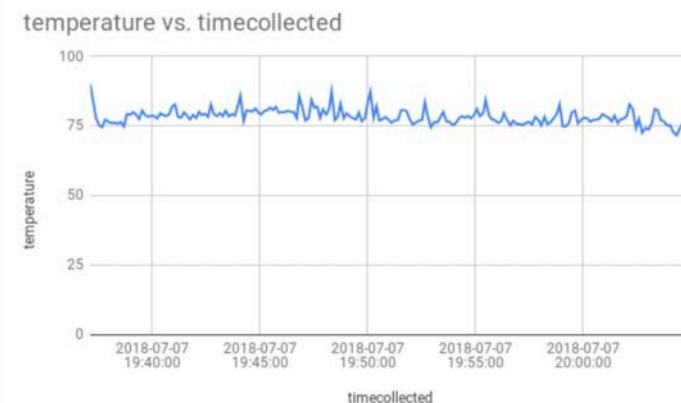

<https://alexpertalia.com/posts/2016/6/22/the-data-pipeline-part-2>

## Building and Running a complete data pipeline

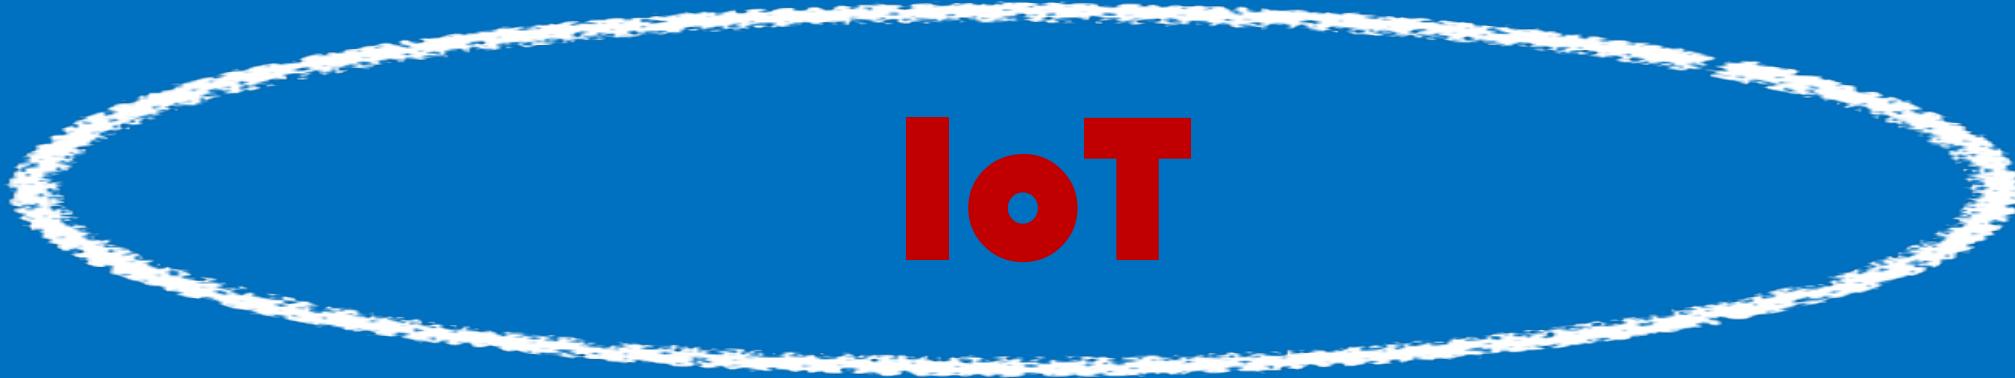

It starts with an internet of things (IoT) device which captures temperature, leverages IoT Core to securely publish the data to a message queue where it will then be transported into a data warehouse.

At the end of this blog we will be able to visualise our data using bigquery and charts in google sheets as shown in the following picture:

# World Wide Web (WWW) vs IoT

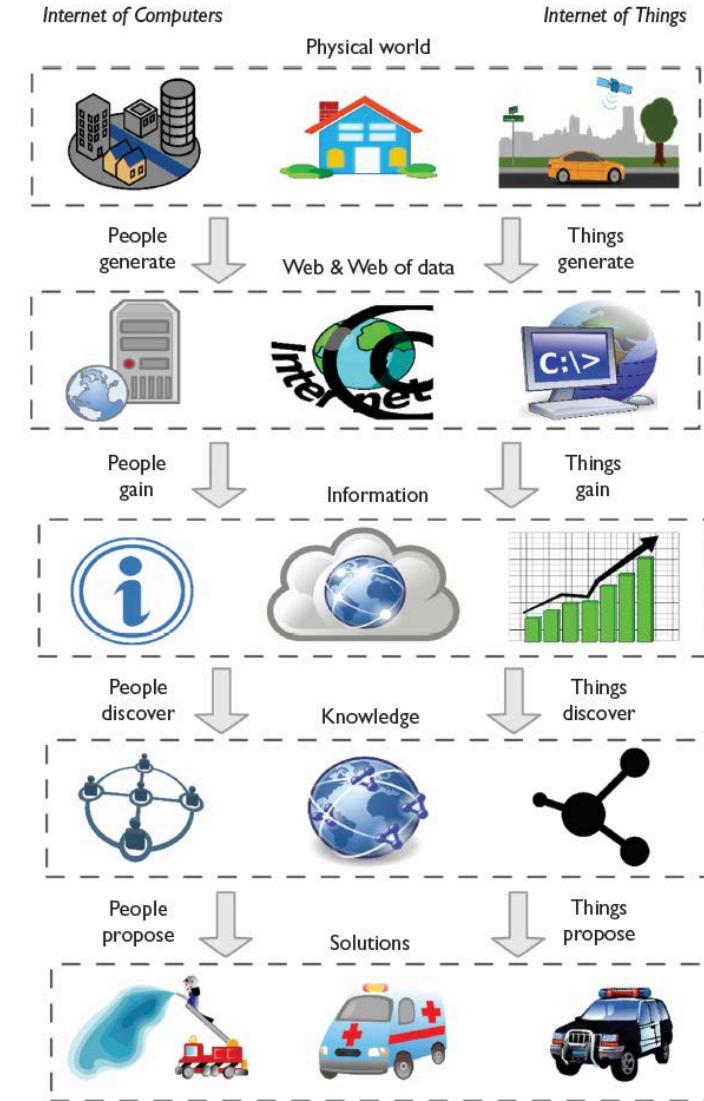

## WWW:

In the Internet of Computers (WWW), the main data producers and consumers are human beings.

## IoT:

The main actors become things, where things are the majority of data producers and consumers.

Qin, Y., Sheng, Q. Z., & Curry, E. (2015). Matching over linked data streams in the internet of things. *IEEE Internet Computing*, 19(3), 21-27.

# IoT Platforms + User-Types

Hobbyists

Consumer

Industrial

Industry

The Internet of Things is a state where the things on the face of the earth connect to the internet and start talking to each other.

Things here can be electronic, electrical, mechanical, or electro-mechanical objects.

# IoT Application Domains

## Consumers

- Connected gadgets
- Appliances
- Wearables
- Domestic robots
- Participatory sensing
- Social Web of Things

## Automotive Transport

- Autonomous vehicles
- Multimodal transport
- Logistics
- Traffic management

## Retail Banking

- Micro payments
- Retail logistics
- Product life-cycle info
- Shopping assistance

## Environmental

- Pollution
- Air, Water, Soil
- Weather, Climate
- Noise
- Erosion, fires

## Infrastructures

- Buildings, Homes
- Roads, Rail

## Utilities

- Smart Grid
- Water management
- Gas, Oil, Renewables
- Waste management
- Heating, Cooling

## Health Well-being

- Remote monitoring
- Assisted living
- Behavioral change
- Treatment compliance
- Sports, Fitness

## Smart Cities

- Integrated environments
- Optimized operations
- Convenience
- Socioeconomics
- Sustainability
- Inclusive living

## Process industries

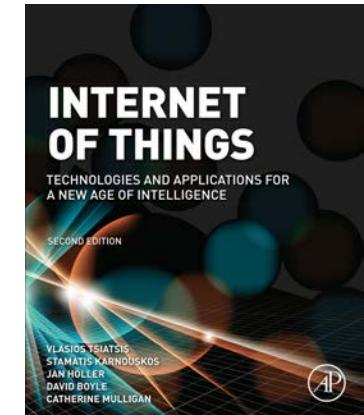

- Robotics
- Manufacturing
- Natural resources
- Remote operations
- Automation
- Heavy machinery

## Agriculture

- Forestry
- Crops and farming
- Urban agriculture
- Livestock, Fisheries

**Smart Systems and the Internet of Things  
are driven by a combination of:**

**1 SENSORS**  
& ACTUATORS

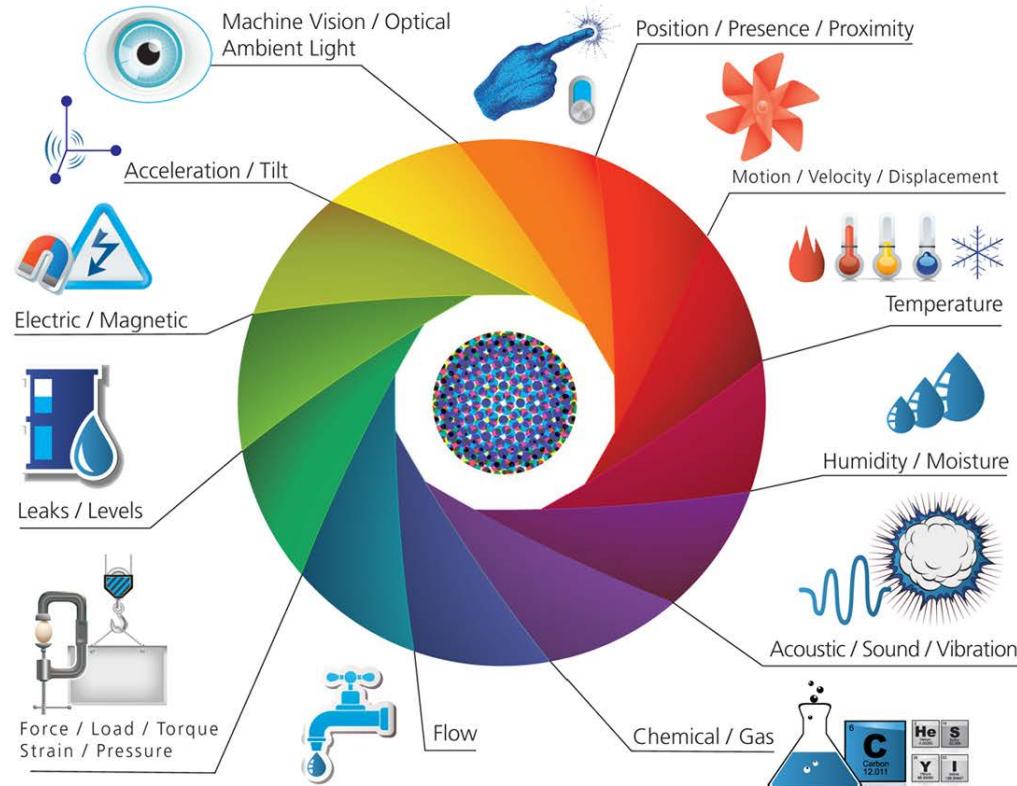

**2 CONNECTIVITY**

**3 PEOPLE &  
PROCESSES**

<http://postscapes.com/what-exactly-is-the-internet-of-things-infographic>

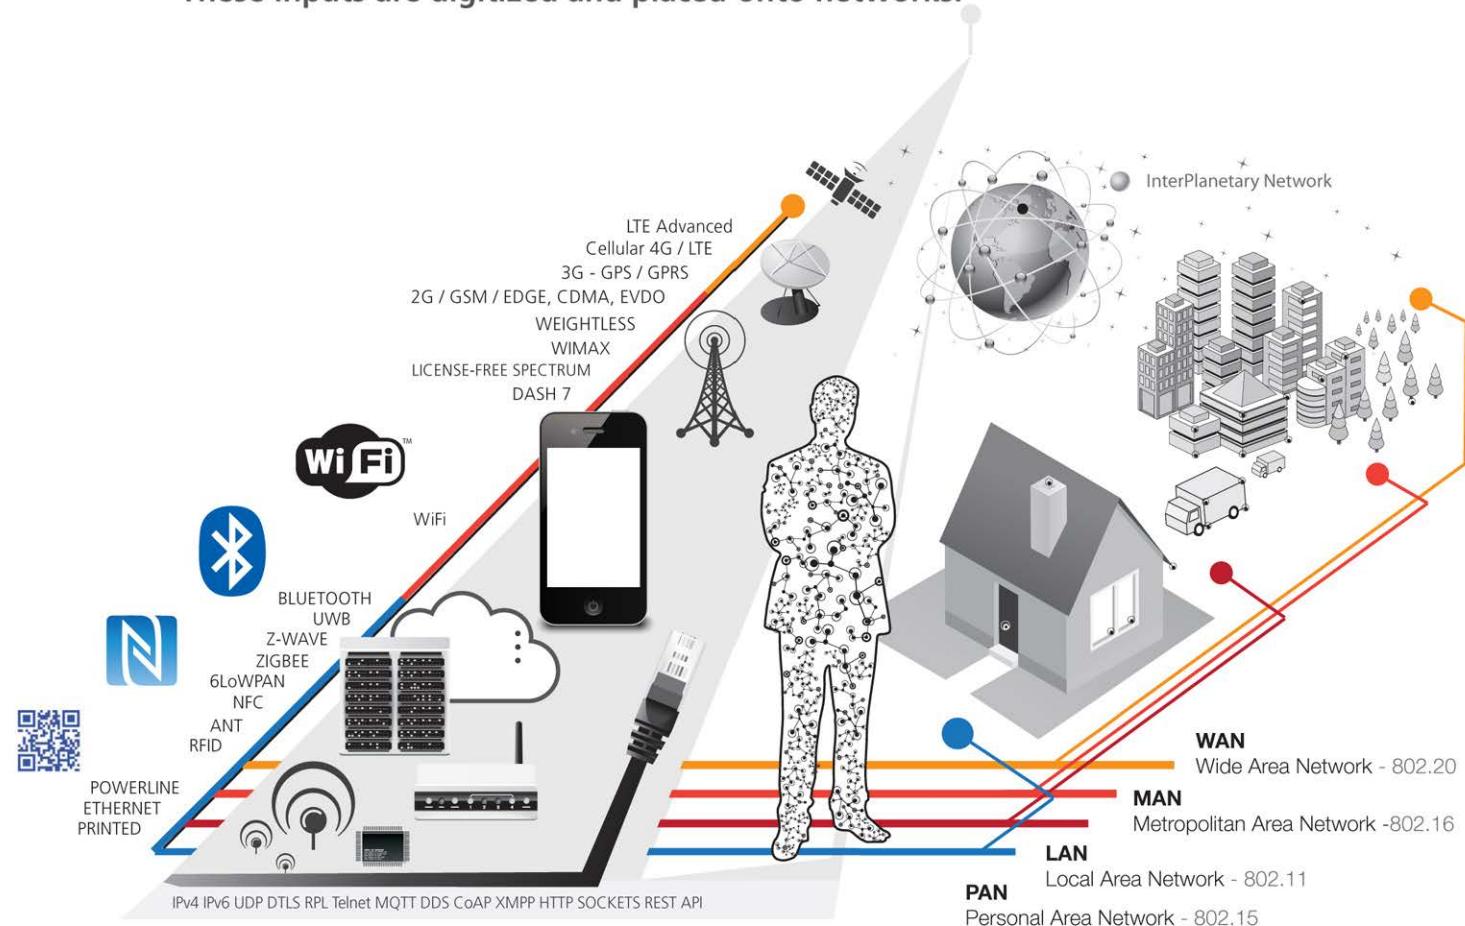

# 1 SENSORS & ACTUATORS

We are giving our world a **digital nervous system**. Location data using GPS sensors. Eyes and ears using cameras and microphones, along with sensory organs that can measure everything from temperature to pressure changes.

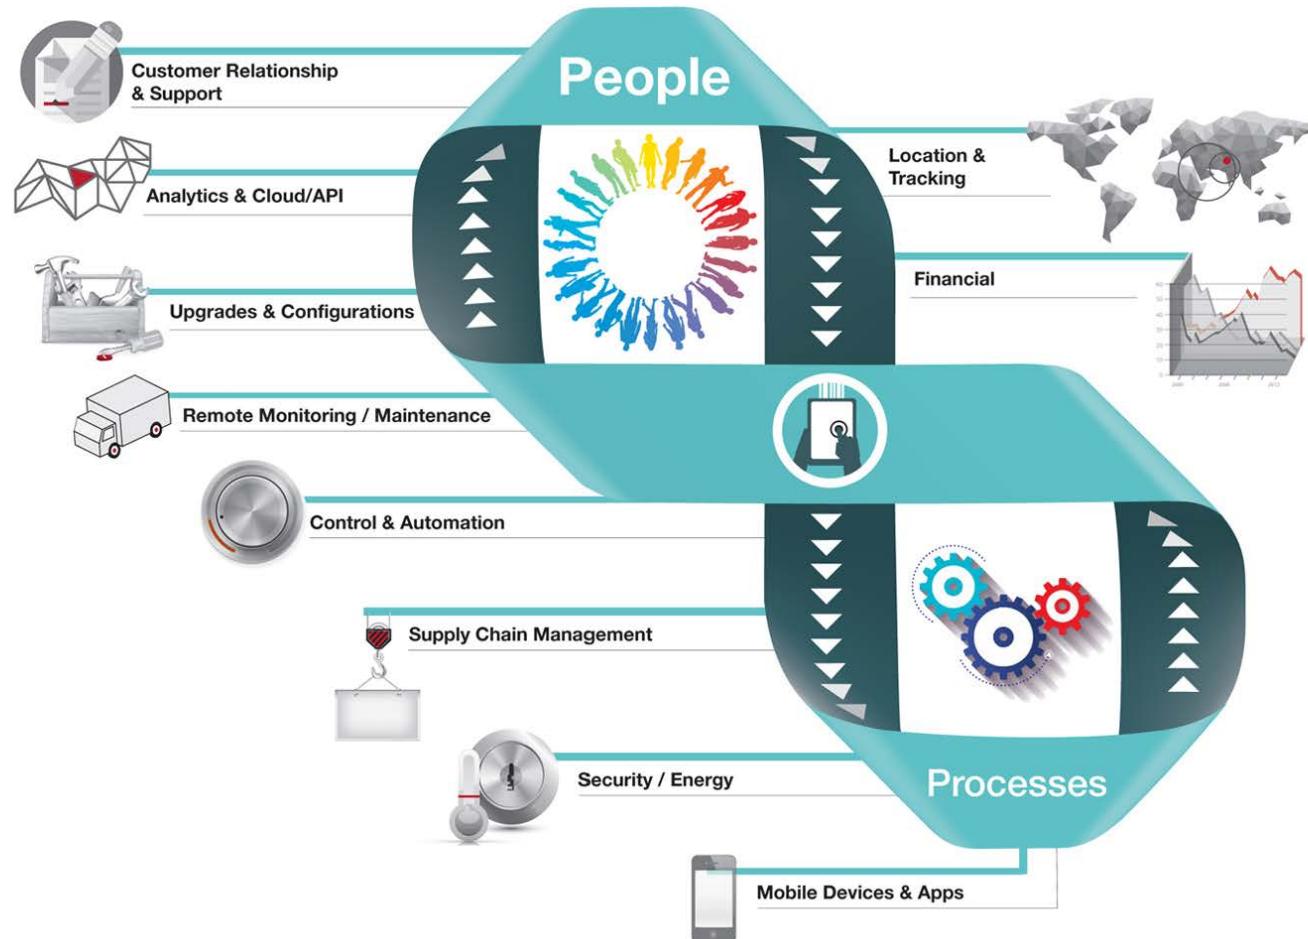

## 2 CONNECTIVITY

These inputs are digitized and placed onto networks.

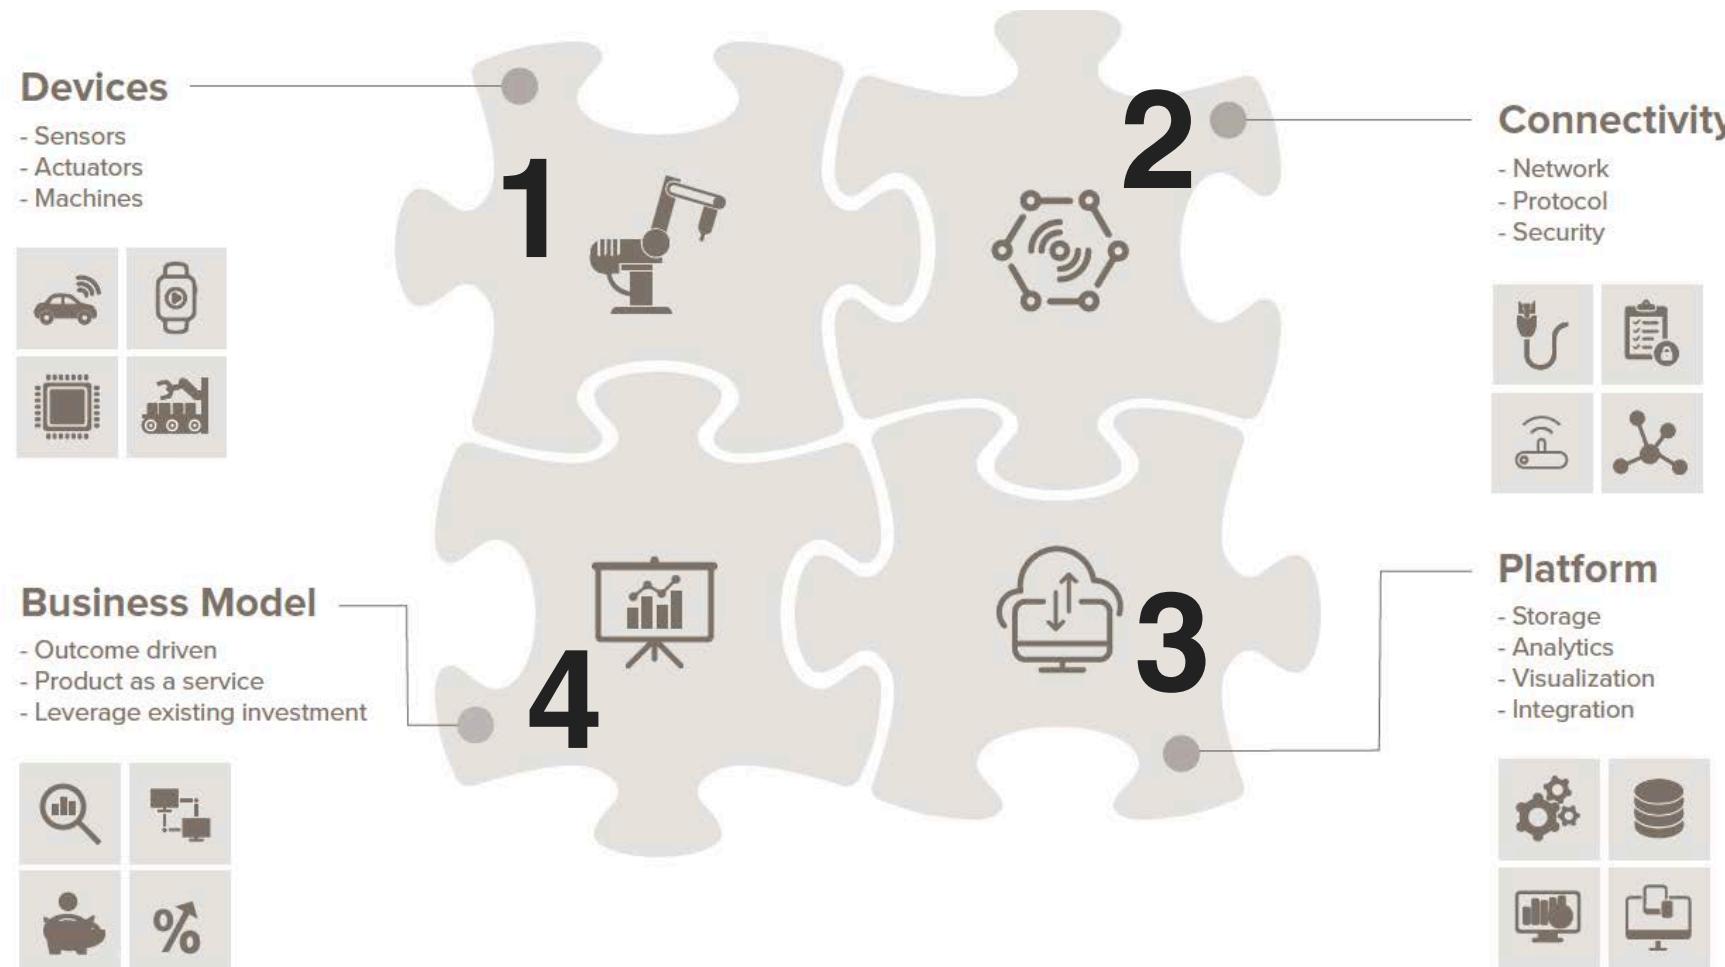

# 3 PEOPLE & PROCESSES

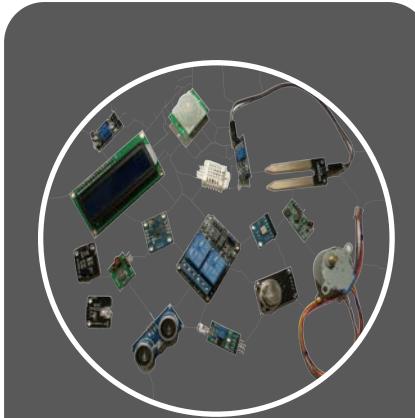

These networked inputs can then be combined into bi-directional systems that integrate data, people, processes and systems for better decision making.

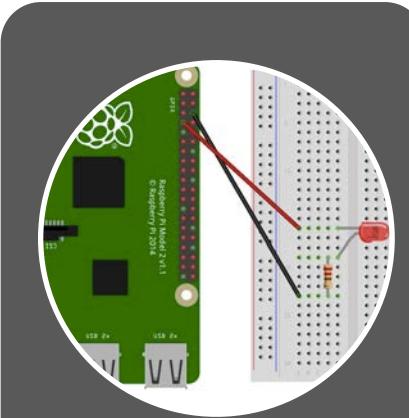

# 4 Pillars of the IoT

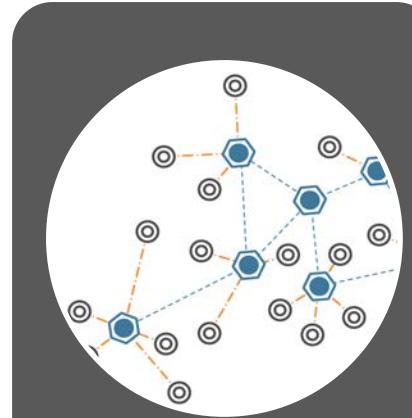

# Engineering a IoT Data Pipeline

Sensors &  
Actuators

Boards)

Network /  
Protocols

Platforms,  
Cloud &  
Data Analytics

# IoT Platforms / MiddleWare

Why do we need these platforms? Why can't we build one of our own?

We can; however, first we have to consider the following points:

- How long does it take for one to build a piece of end-to-end, bug free IoT middleware?
- Your resources' time versus money spent on building this middleware.
- Your in-house team's ability to build an IoT middleware.
- How generic can you build it? Will this IoT middleware scale for all types of applications?

Since almost all IoT platforms have a similar set of features, using a continuously improving, community contributed platform is always better than building one on your own.

## IoT platforms

Now that we have a sense of why we are using an existing IoT platform for our IoT solutions, let us look at the options we have for these platforms. The following are a few popular IoT platforms.

You can visit the site links next to the provider to read more about the offerings:

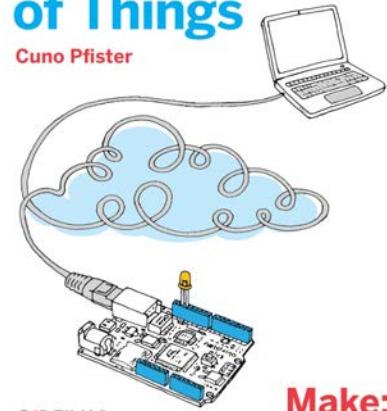

- **AWS IoT:** <https://aws.amazon.com/iot/>
- **Microsoft Azure IoT:** <https://www.microsoft.com/en-in/internet-of-things/azure-iot-suite>

# Getting to Know Your IoT Device

<https://www.youtube.com/watch?v=7vhvnaWUZjE>

# Raspberry Pi

<https://projects.raspberrypi.org/en/projects/raspberry-pi-setting-up>

## Introduction

- What you will need
- Set up your SD card
- Connect your Pi
- Start up your Pi
- Finish the setup
- Where to find help
- What next?

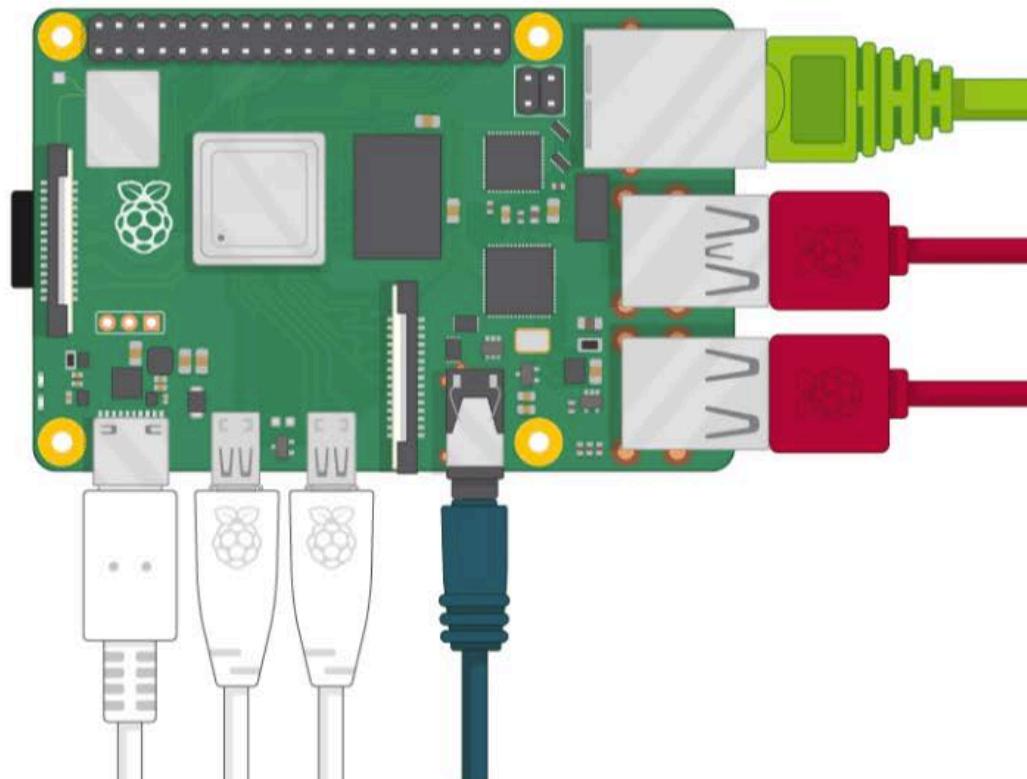

## What is a Raspberry Pi?

The Raspberry Pi is a low cost, **credit-card sized computer** that plugs into a computer monitor or TV, and uses a standard keyboard and mouse. It is a capable little device that enables people of all ages to explore computing, and to learn how to program in languages like Scratch and Python. It's capable of doing everything you'd expect a desktop computer to do, from browsing the internet and playing high-definition video, to making spreadsheets, word-processing, and playing games.

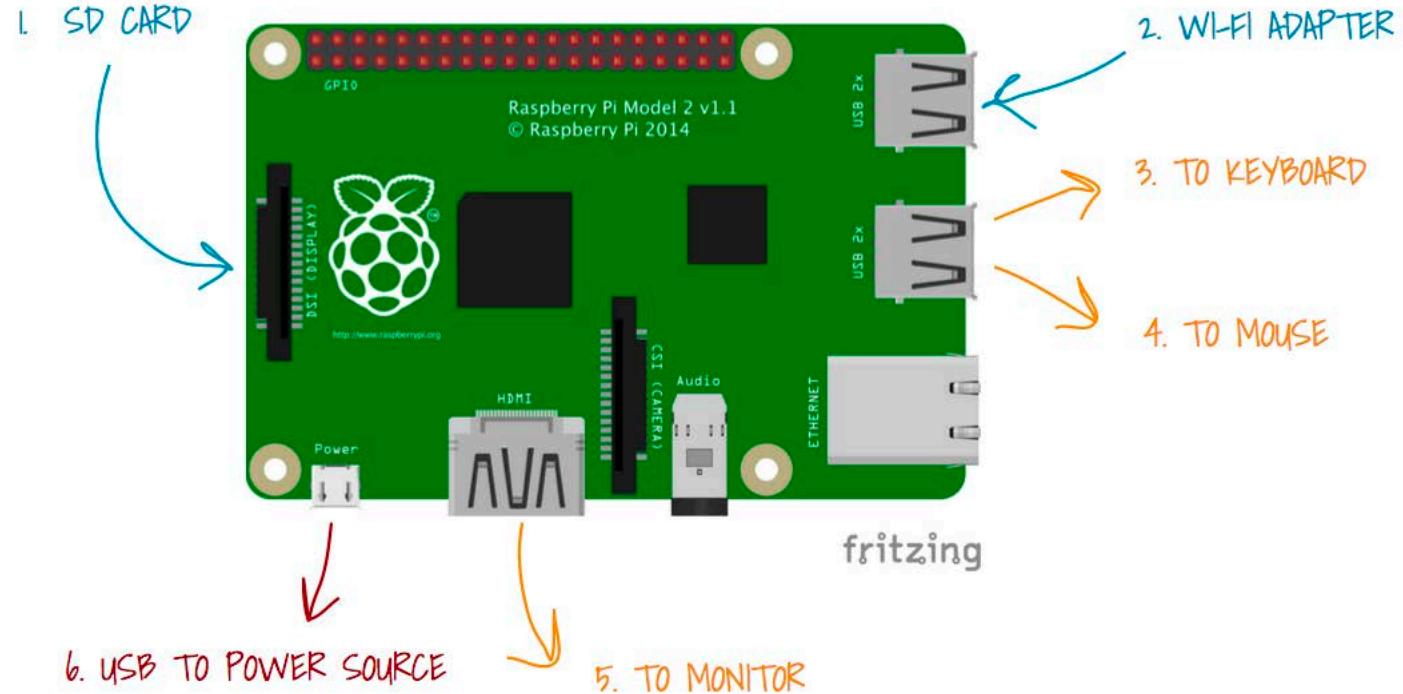

What's more, the Raspberry Pi has the ability to interact with the outside world, and has been used in a wide array of digital maker projects, from music machines and parent detectors to weather stations and tweeting birdhouses with infra-red cameras. We want to see the Raspberry Pi being used by kids all over the world to learn to program and understand how computers work.

## Introduction

Here you'll learn about your Raspberry Pi, what things you need to use it, and how to set it up.

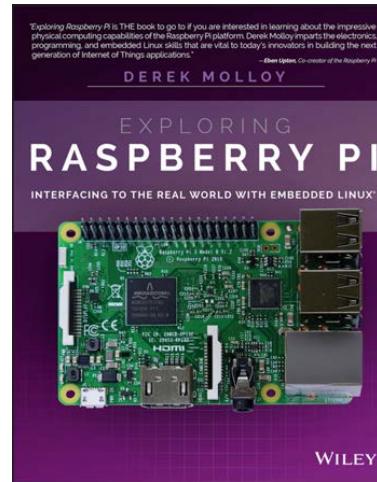

# Main Components Raspberry Pi

# Hardware YOU NEED:

## Raspberry Pi 3 Model A+ or B+

De **Raspberry Pi 3 Model A+** is het nieuwste board in de Raspberry Pi 3 reeks en is een flinke update sinds de eerste A+ die in november 2014 werd geïntroduceerd. Het board heeft 512MB RAM en beschikt net als zijn grote broer over een 64-bit quad core processor op 1.4GHz, dual-band WiFi (2.4GHz en 5GHz) en Bluetooth 4.2/BLE.

### Specificaties

**Processor:** Broadcom BCM2837B0, Cortex-A53 64-bit SoC @ 1.4GHz

**Geheugen:** 512MB LPDDR2 SDRAM

### Connectiviteit:

2.4GHz en 5GHz 802.11b/g/n/ac WiFi

Bluetooth 4.2 / BLE

1x USB 2.0 poort

**Uitbreiding:** 40-pin GPIO header

### Video & Geluid:

1x full-size HDMI

DSI display poort

DSI camera poort

4-polige 3.5mm jack voor stereo audio en composiet video

**Multimedia:** H.264, MPEG-4 decode (1080p30); H.264 encode (1080p30); OpenGL ES 1.1, 2.0 gr

### Stroomvoorziening:

5V / 2.5A DC via microUSB

5V DC via GPIO header

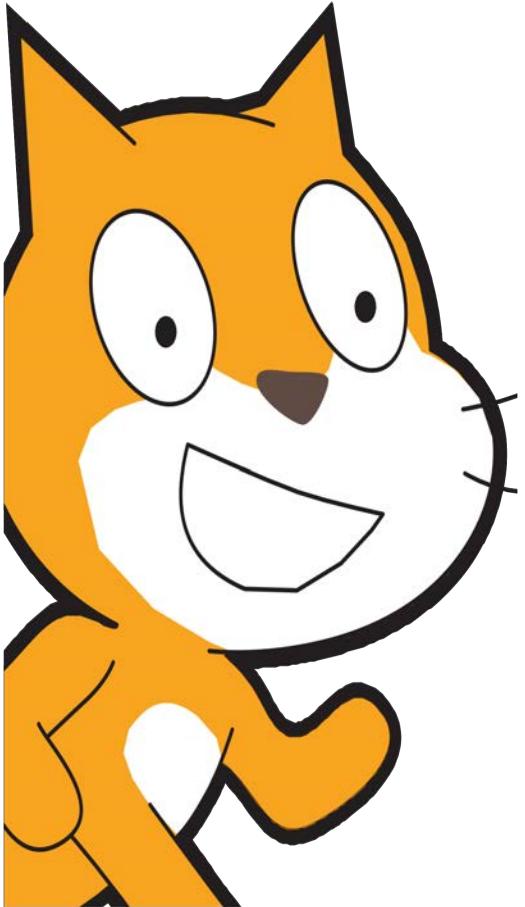

**Afmetingen:** 65x56x8.5mm

**Gewicht:** 29g

# 1<sup>st</sup> STEP Managing Data Science for IoT Projects

## →→→ Getting started with GitHub ←←←

A Computational Thinking culture has an intellectual dimension, engaging with a set of creative concepts and practices. It has a physical dimension, encouraging interactions with others through the placement of desks, chairs, and computers. Most importantly, it has an affective dimension, cultivating a sense of confidence and fearlessness.

### LEARNING OBJECTIVES

---

Students will:

- + be introduced to the concept of computational Thinking, in the context of GitHub
- + be able to imagine possibilities for their own GitHub-based computational thinking
- + become familiar with resources that support their computational thinking
- + prepare for creating GitHub projects by establishing a GitHub account, exploring GitHub, creating design journals

### Tip

Programming involves working with many different file types, each of which is indicated by its **extension** (the letters after the . in the file name, such as .pdf). It is useful to specify that your computer should show these extensions in File Explorer or Finder; see instructions for Windows<sup>a</sup> or for Mac<sup>b</sup> to enable this.

<sup>a</sup><https://helpx.adobe.com/x-productkb/global/show-hidden-files-folders-extensions.html>

<sup>b</sup>[https://support.apple.com/kb/PH25381?locale=en\\_US](https://support.apple.com/kb/PH25381?locale=en_US)

### KEY WORDS, CONCEPTS, & PRACTICES

---

- + IDE
- + GitHub
- + Visual Studio Code

## 1 INSTALLING GIT

One of the most important aspects of doing data science is keeping track of the changes that you (and others) make to your code. `git` is a *version control system* that provides a set of commands that you can use to manage changes to written code, particularly when collaborating with other programmers (version control is described in more detail in Chapter 3).

`git` comes pre-installed on Macs, though it is possible that the first time you try to use the tool you will be prompted to install the *Xcode command line developer tools* via a dialog box. You can choose to install these tools, or download the latest version of `git` online.

On Windows, you will need to download<sup>2</sup> the `git` software. Once you have downloaded the installer, double-click on your downloaded file, and follow the instructions to complete installation. This will also install a program called *Git Bash*, which provides a command line (text-based) interface for executing commands on your computer. See Section 1.1.2 for alternative and additional Windows command line tools.

On Linux, you can install `git` using `apt-get` or a similar command. For more information, see the download page for Linux.<sup>3</sup>

<sup>2</sup> `git` downloads: <https://git-scm.com/downloads>

<sup>3</sup> `git` download for Linux and Unix: <https://git-scm.com/download/linux>

## 2 CREATING A GITHUB ACCOUNT

GitHub<sup>4</sup> is a website that is used to store copies of computer code that are being managed with `git`. To use GitHub, you will need to create a free GitHub account.<sup>5</sup> When you register, remember that your profile is public, and future collaborators or employers may review your GitHub account to assess your background and ongoing projects. Because GitHub leverages the `git` software package, you don't need to install anything else on your machine to use GitHub.

<sup>4</sup> GitHub: <https://github.com>

<sup>5</sup> Join GitHub: <https://github.com/join>

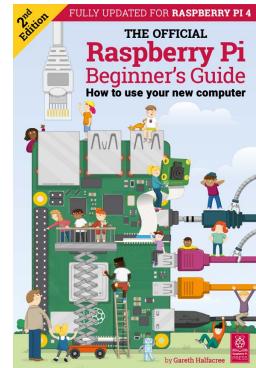

## 3 SELECTING A TEXT EDITOR

**Visual Studio Code**<sup>9</sup> (or VS Code; not to be confused with Visual Studio) is a free, open source editor developed by Microsoft—yes, really. While it focuses on web programming and JavaScript, it readily supports lots of languages, including Markdown and R, and provides a number of extensions for adding even more features. It has a similar command palette to Atom, but isn't quite as nice for editing Markdown specifically. Although fairly new, it is updated regularly and has become one of the authors' main editors for programming.

<sup>9</sup> Visual Studio Code: <https://code.visualstudio.com>

# 2<sup>nd</sup> STEP Managing Data Science for IoT Projects

→→→ Getting to know the **Raspberry Pi** ←←←

Use the **Raspberry Pi Beginner's Guide** +  
<https://www.raspberrypi.org/downloads/raspbian/> to install Raspbian on your own device.

## LEARNING OBJECTIVES

---

Students will:

- + be introduced to the concept of computational Thinking, in the context of **Raspberry Pi**
- + be able to imagine possibilities for their own **Raspberry Pi**-based data science for IoT project
- + become familiar with Raspbian
- + Programming with Python using the Thonny Pyton IDE

**Raspbian**

Raspbian is the Foundation's official supported operating system. You can install it with [NOOBS](#) or download the image below and follow our [installation guide](#).

Raspbian comes pre-installed with plenty of software for education, programming and general use. It has Python, Scratch, Sonic Pi, Java and more.

The Raspbian with Desktop image contained in the ZIP archive is over 4GB in size, which means that these archives use features which are not supported by older unzip tools on some platforms. If you find that the download appears to be corrupt or the file is not unzipping correctly, please try using [7Zip](#) (Windows) or [The Unarchiver](#) (Macintosh). Both are free of charge and have been tested to unzip the image correctly.

#1 **The Verge** – Founded in 2011 The Verge (always in italics!) covers broad spectrum of topics with features, product reviews and podcasts across tech and science and culture, including the arts.

#2 **Mashable** – Founded in 2005 in New York Mashable provides plenty of news and resources for the “Connected Generation.” It’s got perhaps one of the most engaged audiences of all tech communities with 20m monthly unique visitors and over 6m followers on social media platforms.

#3 **TechCrunch** – Like Mashable founded in 2005. TechCrunch enjoys over 12m unique visitors a month, with its community numbering over 2m followers on social media networks. As well as often breaking stories on tech businesses – acquisition and fundraising – its CrunchBase database has become the place to go for information on tech companies, funding and major stories.

#4 **The Next Web** – Founded in 2008 The Next Web has more than 7.2m monthly unique visitors. The Next Web prides itself on giving an international angle to Internet and technology news and culture, and expands its readership through adding new channels and content partnerships. Like TechCrunch it runs events in Europe and North America.

#5 **LifeHacker** – Launched in 2005 Lifehacker bills itself as the place for “Tips, tricks, and downloads for getting things done.” Covering topics as diverse as “From the Tips Box”, anything Windows, Mac, Linux, Android or iOS related, careers, health and wine. Lifehacker also has two international editions – Lifehacker Japan & Lifehacker Australia.

#6 **Wired** – Wired.com (home to WIRED magazine first published in 1993) is part of the massive Conde Nast publishing group – which also owns Reddit (see below) as well as other great blogs such as Ars Technica. Wired’s angle is to look at how ideas and innovation are changing the world. Chris Anderson (writer of The Long Tail, Free) set up his blog GeekDad which was later to become Wired.com. WIRED and Wired.com reach more than 14m readers a month.

#7 **Reddit** – If you’ve not come across Reddit where have you been? A massive community with a simple bulletin board, users post links or self-posts – other members of the community ranking the post or links up or down. The most popular links making the site’s front page. Users build up kudos through the amount of ups/downs their posts and links get – “karma”. Although part of Conde Nast, feels far from commercial.

#8 **Geek** – One of the oldest blogs on our list bust still going strong. Founded in 1996 Geek.com features cover anything from buying guides and review for mobile, gaming, gadgets and computer hardware and software.

#9 **Forbes** – More of a business and lifestyle website than the rest on the list, but Forbes.com has a vast network of writers meaning that there’s always new content – news and commentary. And given Forbes’ size and reputation often with CEOs and senior execs of many of the major technology companies.

#10 **Hongkiat** – The creation of Hongkiat Lim, since 2007 this website has been giving its readers hints, tips and ideas on technology and design. Based in Malaysia this website has grown considerably and is often mentioned itself by many of the bigger sites – such as Lifehacker and TheNextWeb above.
